

**FINDING OF NO SIGNIFICANT IMPACT
FOR THE ISSUANCE OF AN INCIDENTAL HARASSMENT AUTHORIZATION
TO MAINE DEPARTMENT OF TRANSPORTATION (ME DOT)
TO TAKE MARINE MAMMALS BY HARASSMENT INCIDENTAL
TO IN-WATER CONSTRUCTION IN EASTPORT, MAINE**

NATIONAL MARINE FISHERIES SERVICE

BACKGROUND

The National Marine Fisheries Service (NMFS) received an application from the Maine Department of Transportation (ME DOT), requesting an incidental harassment authorization (IHA) to take small numbers of marine mammals, by Level B harassment, incidental to in-water construction activities in Eastport, Maine. Pursuant to the Marine Mammal Protection Act (MMPA; 16 U.S.C. 1361 *et seq.*), authorization for incidental taking shall be granted provided that NMFS: (1) determines that the action will have a negligible impact on the affected species or stocks of marine mammals; (2) finds the action will not have an unmitigable adverse impact on the availability of those species or stocks of marine mammals for taking for subsistence uses; and (3) sets forth, where applicable, the permissible methods of taking, other means of affecting the least practicable impact on affected species and stocks and their habitat, and requirements pertaining to the mitigation, monitoring, and reporting of such takes.

In accordance with the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 *et seq.*), NMFS completed an Environmental Assessment (EA) titled “*Issuance of an Incidental Harassment Authorization to the Maine Department of Transportation (ME DOT) to Take Marine Mammals by Harassment Incidental to Pile Driving in Eastport, Maine.*”

This EA incorporates the Federal Energy Regulatory Commission’s (FERC) and the U.S. Department of Energy’s (DOE) EA (FERC and DOE, 2012) pursuant to 40 CFR § 1502.21.

NMFS has prepared this Finding of No Significant Impact (FONSI) to evaluate the significance of the impacts of NMFS’ action. It is specific to Alternative 2 in the EA, identified as the Preferred Alternative. Under this alternative, NMFS would issue an IHA with required mitigation, monitoring, and reporting measures. Based on NMFS’ review of ME DOT’s proposed activities and the measures contained in Alternative 2, NMFS has determined that no significant impacts to the human environment would occur from implementing the Preferred Alternative.

ANALYSIS

The Council on Environmental Quality (CEQ) regulations at 40 CFR § 1508.27 state that the significance of an action should be analyzed both in terms of "context" and "intensity." Each criterion listed below this section is relevant to making a FONSI and has been considered

individually, as well as in combination with the others. The significance of this action is analyzed based on CEQ's context and intensity criteria. These include:

1) Can the proposed action reasonably be expected to cause substantial damage to the ocean and coastal habitats and/or essential fish habitat as defined under the Magnuson-Stevens Act and identified in Fishery Management Plans (FMP)?

Response: NMFS does not anticipate that either ME DOT's proposed construction activities (*i.e.*, pile driving) or NMFS' proposed action (*i.e.*, issuing an IHA to ME DOT) would cause substantial damage to ocean and coastal habitats. The proposed NMFS action would authorize Level B harassment of marine mammals, incidental to in-water construction activities occurring non-continuously for one year in Eastport, Maine.

NMFS believes that with the proposed mitigation and monitoring measures in place (as detailed in the proposed IHA), activity conducted under the requirements of the IHA would have no more than minimal adverse impacts to fish or invertebrates and their habitats, and would have no potential for population-level impacts to any fish or invertebrate species. These temporary acoustic activities would not affect physical habitat features, such as substrates and water quality. The Magnuson-Stevens Fishery Conservation and Management Act (MSFCA) governs marine fisheries management in waters within the U.S. Exclusive Economic Zone, and requires federal agencies to consult with NMFS with respect to actions that may adversely impact Essential Fish Habitat (EFH). NMFS Greater Atlantic Region Fisheries Office is working with the applicant to provide EFH conservation recommendations.

2) Can the proposed action be expected to have a substantial impact on biodiversity and/or ecosystem function within the affected area (*e.g.*, benthic productivity, predator-prey relationships, etc.)?

Response: NMFS does not expect either ME DOT's proposed construction activities or NMFS' proposed action (*i.e.*, issuing an IHA to ME DOT that authorizes Level B harassment) to have a substantial impact on biodiversity or ecosystem function within the affected environment.

NMFS' EA incorporated FERC and DOE's EA by reference to analyze the potential for the survey activity to affect other ecosystem features and biodiversity components, including fish, invertebrates, seabirds, and sea turtles. NMFS expects that any direct, indirect, or cumulative effects of the action would not result in a substantial impact on biodiversity or ecosystem function. The effects are considered to be short-term, temporary in nature, and minimal, and would be highly unlikely to affect normal ecosystem function or predator/prey relationships; therefore, there would not be a substantial impact on marine life biodiversity or on the normal function of the marine environment within the area affected by the proposed activity.

3) Can the proposed action reasonably be expected to have a substantial adverse impact on public health or safety?

Response: NMFS does not expect either ME DOT's construction activities or NMFS' proposed action (*i.e.*, issuing an IHA to ME DOT) to have a substantial adverse impact on public health or safety. The proposed in-water construction activities would occur during daylight hours near the shore in Eastport, ME. The constant monitoring for marine mammals and other marine life during

in-water construction activities effectively eliminates the possibility of any humans being inadvertently exposed to levels of sound that might have adverse effects. Although the conduct of the activity may carry some risk to the personnel involved (*i.e.*, mechanical accidents during operation), the applicant and those individuals working with the applicant would be required to be adequately trained or supervised in performance of the underlying activity to minimize such risk to personnel. In-water construction activities are not expected to have any adverse impacts on traffic and transportation, as construction would occur during daylight hours for a limited period of time over a small geographic area. In addition, there is little risk of exposure to hazardous materials or wastes, risk of contracting diseases, or risk of damage from a natural disaster.

4) Can the proposed action reasonably be expected to adversely affect endangered or threatened species, their critical habitat, marine mammals, or other non-target species?

Response: NMFS has determined that the proposed activity may result in some Level B harassment (in the form of short-term and localized changes in behavior) of small numbers, relative to the population sizes, of four species of marine mammals, none of which are listed under the Endangered Species Act (ESA; 16 U.S.C. 1531 *et seq.*). The EA evaluates the affected environment and potential effects of NMFS' (*i.e.*, issuing an IHA to ME DOT) and ME DOT's actions (*i.e.*, pile driving), indicating that only the acoustic activities have the potential to affect marine mammals in a way that requires authorization under the MMPA. The following mitigation and monitoring measures are expected to minimize potential adverse effects to protected species:

- (1) exclusion zones for both vibratory and impact pile driving;
- (2) shut-down and delay procedures;
- (3) soft-start procedures;
- (4) use of sound attenuation device
- (5) visual monitoring by Protected Species Observers (PSOs); and
- (5) timing restrictions.

Considering these measures, responses of marine mammals from the preferred alternative are expected to be limited to temporary avoidance of the area around the pile hammer and short-term behavioral changes, falling within the MMPA definition of "Level B harassment."

NMFS does not anticipate that marine mammal take by injury (Level A harassment), serious injury, or mortality would occur and expects that harassment takes would be at the lowest level practicable due to the incorporation of the mitigation measures required by the IHA. Numbers of individuals of all marine mammal species taken by harassment are expected to be extremely small (relative to species or stock abundance), and the take is anticipated to have a negligible impact on any species or stock. The impacts of the construction activities on marine mammals are specifically related to acoustic activities, and these are expected to be temporary in nature, negligible, and would not result in substantial impact to marine mammals or to their role in the ecosystem. FERC and DOE's EA addresses potential effects to other marine life, such as birds, fish, and invertebrates. With conservation recommendations, and mitigation and monitoring measures in place, any effects to marine life should be minimal.

5) Are significant social or economic impacts interrelated with natural or physical environmental effects?

Response: The primary impacts to the natural and physical environment are expected to be acoustic and temporary in nature (and not significant), and not interrelated with significant social or economic impacts. Issuance of the IHA would not result in inequitable distributions of environmental burdens or access to environmental goods.

NMFS has determined that issuance of the IHA would have no impact of the activity on the availability of the species or stocks of marine mammals for subsistence uses. Therefore, no significant social or economic effects are expected to result from issuance of the IHA or the proposed activity.

6) Are the effects on the quality of the human environment likely to be highly controversial?

Response: The effects of this action on the quality of the human environment, that is, NMFS' proposed issuance of an IHA for the take of marine mammals incidental to in-water construction activities, are not highly controversial. NMFS will address public comments on the proposed IHA in a *Federal Register* notice. Specifically, there is not a substantial dispute about the size, nature, or effect of potential impacts from NMFS' proposed action or ME DOT's proposed construction activities.

7) Can the proposed action reasonably be expected to result in substantial impacts to unique areas, such as historic or cultural resources, park land, prime farmlands, wetlands, wild and scenic rivers, essential fish habitat, or ecologically critical areas?

Response: There would be no substantial impacts because the work would be temporary and occur in a small area. Detailed information about the affected environment, marine mammals and other marine life, and all potential adverse direct, indirect and cumulative impacts related to the proposed action are provided in the EA and material incorporated by reference.

8) Are the effects on the human environment likely to be highly uncertain or involve unique or unknown risks?

Response: The potential risks of pile driving are not unique or unknown, nor is there significant uncertainty about impacts. NMFS has issued numerous IHAs for these types of in-water construction activities in numerous locations and conducted NEPA analysis on those projects. Each of these projects required marine mammal monitoring and monitoring reports have been reviewed by NMFS to ensure that activities have a negligible impact on marine mammals. In no case have impacts to marine mammals, as determined from monitoring reports, exceeded NMFS' analysis under the MMPA and NEPA. Therefore, the effects on the human environment are not likely to be highly uncertain or involve unique or unknown risks.

9) Is the proposed action related to other actions with individually insignificant, but cumulatively significant impacts?

Response: Issuance of an IHA to ME DOT would not be related to other actions with individually insignificant, but cumulatively significant impacts. Currently, there are no ME DOT projects that would contribute to cumulative significant impacts to marine mammals for Cobscook Bay (E. Hamm, ME DOT, pers. comm. 2016). However, the Department of Energy's National Renewable Energy Laboratory, is proposing to authorize a project to collect tidal resource data in

Cobscook Bay, Maine. The action will include temporary deployment and testing of two bottom-lander mounted Acoustic Doppler Current Profilers (ADCPs), one Stablemoor device and conducting mobile transects from November 2016 through January 2017 to develop a resource assessment for tidal energy resources in Cobscook Bay, Maine. The ADCPs and Stablemoor device would be deployed off the coast of Eastport in Cobscook Bay, Maine (Latitude 44°93'9313", Longitude -67°00'6.198"). This project is undergoing consultation with NMFS Greater Atlantic Regional Fisheries Office (D. Bean, NMFS, pers. comm. 2016). Any future authorizations would have to undergo the same permitting process and would take ME DOT's in-water construction activities into consideration when addressing cumulative effects.

10) Is the proposed action likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural or historical resources?

Response: The proposed activity is not likely to adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic places or cause loss or destruction of significant scientific, cultural, or historical resources, because none of the above is present in the vicinity of the construction area.

11) Can the proposed action reasonably be expected to result in the introduction or spread of a non-indigenous species?

Response: The proposed action cannot be reasonably expected to result in the introduction or spread of a non-indigenous species. The spread of non-indigenous species generally occurs through ballast water or hull attachment. Support vessels used during construction would likely be small, local vessels that do not make trans-ocean trips. As such, no non-indigenous species are likely to enter Cobscook Bay through support vessels used during the specified activity.

12) Is the proposed action likely to establish a precedent for future actions with significant effects or does it represent a decision in principle about a future consideration?

Response: The proposed action would not set a precedent for future actions with significant effects or represent a decision in principle. Each MMPA authorization applied for under 101(a)(5) must contain information identified in NMFS' implementing regulations with no exceptions. NMFS considers each activity specified in an application separately and, if it issues an IHA to the applicant, NMFS must determine that the impacts from the specified activity would result in a negligible impact to the affected species or stocks.

NMFS has issued many authorizations for similar pile driving activities. A FONSI for this action, may inform the environmental review for future projects but would not establish a precedent or represent a decision in principle about a future consideration.

13) Can the proposed action reasonably be expected to threaten a violation of any Federal, State, or local law or requirements imposed for the protection of the environment?

Response: Issuance of the proposed IHA would not violate any federal, state, or local laws for environmental protection. The applicant consulted with the appropriate federal, state, and local

agencies during the application process and would be required to follow associated laws as a condition of the IHA.

14) Can the proposed action reasonably be expected to result in cumulative adverse effects that could have a substantial effect on the target species or non-target species?

Response: The proposed action would allow for the taking, by incidental harassment, of marine mammals during the proposed pile driving activities. NMFS has determined that marine mammals may exhibit behavioral changes such as avoidance of or changes in foraging patterns within the action area. However, NMFS does not expect the authorized harassment to result in significant cumulative adverse effects on the affected species or stocks. Currently, there are no other incidental take authorizations specifically for Cobscook Bay or other ME DOT projects that would contribute to cumulative significant impacts to marine mammals for Cobscook Bay (E. Ham, ME DOT, pers. comm. 2016). However, because pile driving impacts would be short term and localized and each Holder is required to comply with mitigation and monitoring measures designed to minimize exposure and impacts, no substantial adverse cumulative impacts are anticipated. Pile driving activities and the issuance of an IHA would not be expected to result in any significant cumulative adverse effects on target or non-target species incidentally taken by harassment.

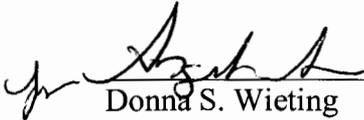

Cumulative effects refer to the impacts on the environment that result from a combination of past, existing, and reasonably foreseeable human activities and natural processes. As evaluated in the EA, human activities in the region of the proposed action include vessel traffic, commercial fishing, marine resource harvesting, and aquaculture. Those activities, as described in the EA, when conducted separately or in combination with other activities, could adversely affect marine species in the proposed action area. Because of the limited amount of pile driving and proposed mitigation and monitoring measures, the action would not result in synergistic or cumulative adverse effects that could have a substantial effect on any species.

The proposed action does not target any marine species and is not expected to result in any individual, long-term, or cumulative adverse effects on the species incidentally taken by harassment due to these activities. The potential temporary behavioral disturbance of marine species might result in short-term behavioral effects for these marine species within the ensonified zones, but no long-term displacement of marine mammals, endangered species, or their prey is expected as a result of the proposed action conducted under the requirements of the IHA. Therefore, NMFS does not expect any cumulative adverse effects on any species as a result of pile activities.

DETERMINATION

In view of the information presented in this document and the analysis contained in the supporting EA titled "*Issuance of an Incidental Harassment Authorization to Maine Department of Transportation (ME DOT) to Take Marine Mammals by Harassment Incidental to In-Water Construction Activities in Eastport, Maine,*" and documents that it references, NMFS has determined that issuance of an IHA to ME DOT for the take, by Level B harassment only, of small numbers of marine mammals incidental to in-water construction activities in accordance with Alternative 2 in NMFS' 2016 EA will not significantly impact the quality of the human environment, as described in this FONSI, in the EA, and in FERC and DOE's EA.

In addition, all beneficial and adverse impacts of the action have been addressed to reach the conclusion of no significant impacts. Accordingly, preparation of an Environmental Impact Statement for this action is not necessary. The EA thereby provides a supporting analysis for this FONSI.
